differential equations are the pre eminent modelling device of engineering and the applied sciences this volume contains a refereed subset of papers presented at the 1991 imacs world congress a natural subdivision occurred general theory specific differential equations and computational methods there are eleven papers in the area termed general theory seventeen papers concern specific differential equations both ordinary and partial which have been used to model various phenomena finally fourteen papers are devoted to a variety of computational methods

of a monograph on a single topic this is the theory of nonlinear ordinary differential equations the solutions of which have no movable singularities other than poles and the extension of this theory to partial differential equations for short we shall call such systems equations with the painleve property the search for such equations was a very topical mathematical problem in the 19th century early work concentrated on first order differential equations one of painleve s important contributions in this field was to develop simple methods applicable to higher order equations in particular these methods made possible a complete analysis of the equation $f(y) y' = g(x)$ where f is a rational function of y and y' with coefficients that are analytic in x the fundamental result due to painleve *acta math*
