Irrational Numbers 1957 in this monograph ivan niven provides a masterful exposition of some central results on irrational transcendental and normal numbers he gives a complete treatment by elementary methods of the irrationality of the exponential logarithmic and trigonometric functions with rational arguments the approximation of irrational numbers by rationals up to such results as the best possible approximation of hurwitz is also given with elementary techniques the last third of the monograph treats normal and transcendental numbers including the transcendence of p and its generalization in the lindemann theorem and the gelfond schneider theorem most of the material in the first two thirds of the book presupposes only calculus and beginning number theory the book is almost wholly self contained the results needed from analysis and algebra are central and well known theorems and complete references to standard works are given to help the beginner the chapters are for the most part independent there is a set of notes at the end of each chapter citing the main sources used by the author and suggesting further reading

Practice Makes Perfect Basic Math 2012-06-08 dr manning s book on irrational numbers contains a presentation in a simple form of another field of mathematical inquiry such as is also eminently suited for placing in the hands of the ordinary schoolmaster we have decided that the geometry of proportion shall be taught to schoolboys without reference to irrational quantities but we have not yet eliminated a spirit of reckless extravagance in the quite unnecessary use of infinite series often with total disregard for their convergency in dr manning s treatment an irrational number is defined as forming a point of separation between rational numbers of two classes the numbers of one class being less than those of the other this definition appears to involve the assumption pp 7 10 c that the point of separation is unique in other words that there cannot be two irrational numbers which have not some rational number separating them perhaps this assumption may be regarded as a definition of equality of irrational numbers in any case the inquiring reader would find it necessary to examine more fully the references to dedekind s and cantor s writings given on p 56 once the assumption or definition is made the representation of numbers by sequences readily follows the theory of limits is discussed on p 57 and in the following chapter the notion of a sequence is shown to give rise to that of a series the remaining portion of the book is mainly devoted to the study of convergence and includes the well known multiplication theorem and applications to the still better known binomial and exponential series nature vol 75

Effective Math Instruction 2016-02-01 this book presents a new approach to the epistemology of mathematics by viewing mathematics as a human activity whose knowledge is intimately linked with practice charting an exciting new direction in the philosophy of mathematics josé ferreirós uses the crucial idea of a continuum to provide an account of the development of mathematical knowledge that reflects the actual experience of doing math and makes sense of the perceived objectivity of mathematical results describing a historically oriented agent based philosophy of mathematics ferreirós shows how the mathematical tradition evolved from euclidean geometry to the real numbers and set theoretic structures he argues for the need to take into account a whole web of mathematical and other practices that are learned and linked by agents and whose interplay acts as a constraint ferreirós demonstrates how advanced mathematics far from being a priori is based on hypotheses in contrast to elementary math which has strong cognitive and practical roots and therefore enjoys certainty offering a wealth of philosophical and historical insights mathematical knowledge and the interplay of practices challenges us to rethink some of our most basic assumptions about mathematics its objectivity and its relationship to culture and science
