a comprehensive introduction to using modeling and simulation programs in drug discovery and development biopharmaceutical modeling has become integral to the design and development of new drugs influencing key aspects of the development process including drug substance design formulation design and toxicological exposure assessment biopharmaceutical modeling is now seen as the linchpin to a drug's future success and while there are a number of commercially available software programs for drug modeling there has not been a single resource guiding pharmaceutical professionals to the actual tools and practices needed to design and test safe drugs a guide to the basics of modeling and simulation programs biopharmaceutics modeling and simulations offers pharmaceutical scientists the keys to understanding how they work and are applied in creating drugs with desired medicinal properties beginning with a focus on the oral absorption of drugs the book discusses the central dogma of oral drug absorption the interplay

of dissolution solubility and permeability of a drug which forms the basis of the biopharmaceutical classification system bcs the concept of drug concentration how to simulate key drug absorption processes the physiological and drug property data used for biopharmaceutical modeling reliable practices for reporting results with over 200 figures and illustrations and a peerless examination of all the key aspects of drug research including running and interpreting models validation and compound and formulation selection this reference seamlessly brings together the proven practical approaches essential to developing the safe and effective medicines of tomorrow

traditionally symbiosis research has been undertaken by researchers

working independently of one another and often focused on a few cases of bipartite host symbiont interactions new model systems are emerging that will enable us to fill fundamental gaps in symbiosis research and theory focusing on a broad range of symbiotic interactions and including a variety of multicellular hosts and their complex microbial communities in this research topic we invited researchers to contribute their work on diverse symbiotic networks since there are a large variety of symbioses with major roles in the proper functioning of terrestrial or aquatic ecosystems and we wished the topic to provide a venue for communicating findings across diverse taxonomic groups a synthesis of recent investigations in symbiosis can impact areas such as agriculture where a basic understanding of plant microbe symbiosis will provide foundational information on the increasingly important issue of nitrogen fixation climate change where anthropogenic factors are threatening the survival of marine symbiotic ecosystems such as coral reefs animal and human health where unbalances in host microbiomes are being increasingly associated with a wide range of diseases and biotechnology where process optimization can be achieved through optimization of symbiotic partnerships overall our vision was to produce a volume of works that will help define general principles of symbiosis within a new conceptual framework in the road to finally establish symbiology as an overdue central discipline of biological science

rivers form one of the lifelines in our society by providing essential

services such as availability of fresh water navigation energy ecosystem services and flood conveyance because of this essential role mankind has interfered continuously in order to benefit most and at the same time avoid adverse consequences such as flood risk and droughts this has resulted in often highly engineered rivers with a narrow set of functions in the last decades rivers are increasingly considered in a more holistic manner as a system with a multitude of interdependent processes river research and engineering has therefore added to the river fundamentals also themes like ecohydraulics consequences of climate change and urbanisation river flow 2020 contains the contributions presented at the 10th conference on fluvial hydraulics river flow 2020 organised under the auspices of the committee on fluvial hydraulics of the international association for hydro environment engineering and research iahr what should have been a lively physical gathering of researchers students and practitioners was converted into an online event as the covid 19 pandemic hindered international travelling and large gatherings of people nevertheless the fluvial hydraulics community showed their interest and to be very much alive with a high number of participations for such event since its first edition in 2002 in louvain la neuve this series of conferences has found a large and loyal audience in the river research and engineering community while being also attractive to the new researchers and young professionals this is highlighted by the large number of contributions applying for the coleman award for young researchers and also by the number of applications and attendants to the master classes which are aimed at young researchers and students river flow 2020 aims to provide an updated overview of the ongoing research in this wide range of topics and contains five major themes which are focus of research in the fluvial environment river fundamentals the digital river the healthy river extreme events and rivers under pressure other highlights of river flow 2020 include the substantial number of interdisciplinary subthemes and sessions of special interest the contributions will therefore be of interest to academics in hydraulics hydrology and environmental engineering as well as practitioners that would like to be updated about the newest findings and hot themes in river research and engineering
