technology is entering into every aspect of the supply chain and providing performant and innovative tools as many are just starting to talk about the dematerialization of certain documents used in trade and transport others are investigating how devices can communicate information directly to the rest of the supply chain without human intervention smart containers are taking the digital age of shipping one step further beyond paperless processes by embracing the internet of things iot to support enhanced decision making by the various sectoral stakeholders this provides greater visibility to the stakeholders within the transaction as well as to regulatory agencies who need detailed information on the consignments before they arrive at the border this technology can be combined with other innovations such as blockchain big data or data pipelines to provide even more facilitation to the trading community in all of these cases though we see that creating clear unambiguous message exchange standards will allow to capitalize the full potential of the enhanced data this paper provides a detailed look into the various benefits of using smart containers as well as the various potential use cases for this technology the project team continues its work to provide clear semantic standards for the exchange of this data in order to ensure that all stakeholders understand the same information in the same way

container transportation is the predominant mode of inter continental cargo traffic since container ships and port terminals involve a huge capital investment and significant daily operating costs it is of crucial importance to efficiently utilize the internal resources of container terminals and transportation systems today there is an ongoing trend to use automated container handling and transportation technology in particular in countries with high labour costs this in turn requires highly sophisticated control strategies in order to meet the desired performance measures the primary objective of this book is to reflect these recent developments and to present new insights and successful solutions to operational problems of automated container terminals and transportation systems it comprises reports on the state

of the art applications of quantitative methods as well as case studies and simulation results its contributions are written by leading experts from academia and business the book addresses practitioners as well as academic researchers in logistics transportation and management

the storage yard is the operational and geographical centre of most seaport container terminals therefore it is of particular importance for the whole terminal system and plays a major role for trade and transport flows one of the latest trends in container storage operations is the automated rail mounted gantry crane system which offers dense stacking and offers low labour costs this book investigates whether the operational performance of container terminals is influenced by the design of these storage systems and to what extent the performance is affected by the terminal s framework conditions and discusses the strategies applied for container stacking and crane scheduling a detailed simulation model is presented to compare the performance effects of alternative storage designs innovative planning strategies and other influencing factors the results have useful implications future research practical terminal planning and optimisation

the book takes the inventory control perspective to tackle empty container repositioning logistics problems in regional transportation systems by explicitly considering the features such as demand imbalance over space dynamic operations over time uncertainty in demand and transport and container leasing phenomenon the book has the following unique features first it provides a discussion of broad empty equipment logistics including empty freight vehicle redistribution empty passenger vehicle redistribution empty bike repositioning empty container chassis repositioning and empty container repositioning ecr problems the similarity and unique characteristics of ecr compared to other empty equipment repositioning problems are explained second we adopt the stochastic dynamic programming approach to tackle the ecr problems which offers an algorithmic strategy to characterize the optimal policy and captures the sequential decision making phenomenon in anticipation of uncertainties over time and space third we are able to establish closed form solutions and structural properties of the

optimal ecr policies in relatively simple transportation systems such properties can then be utilized to construct threshold type ecr policies for more complicated transportation systems in fact the threshold type ecr policies resemble the well known s s and s q policies in inventory control theory these policies have the advantages of being decentralized easy to understand easy to operate quick response to random events and minimal on line computation and communication fourth several sophisticated optimization techniques such as approximate dynamic programming simulation based meta heuristics stochastic approximation perturbation analysis and ordinal optimization methods are introduced to solve the complex stochastic optimization problems the book will be of interest to researchers and professionals in logistics transport supply chain and operations research

the yard block of a container terminal is the central point of synchronisation for asynchronous container flows between deep sea vessels and transport to the hinterland the structure of the block stipulates that containers are stacked on top of each other with only the topmost container directly accessible by a yard crane this book describes a holistic and integrative approach to container handling in yard blocks to optimise productivity by minimising re handling operations the results provide insights for academic scholars as well as for experts from practical terminal planning and operations the approach presented is two fold first a theoretical foundation of the interdependencies in decision making is established using mathematical programming secondly operations involving uncertain container arrival information are examined on the basis of a simulation with a rigorous experimental design and statistical evaluation in this context the book develops container handling strategies and analyses the impact of a system for vehicle arrival management the terminal appointment system the findings presented in this book are the result of a close cooperation with experts at the port of hamburg and build on previous research
