only to the academic and corporate training market but also to new and aspiring professionals including data analysts seeking a reliable practical desktop reference the ability to learn is a fundamental characteristic of intelligent behavior consequently machine learning has been a focus of artificial intelligence since the beginnings of ai in the 1950s the 1980s saw tremendous growth in the field and this growth promises to continue with valuable contributions to science engineering and business readings in machine learning collects the best of the published machine learning literature including papers that address a wide range of learning tasks and that introduce a variety of techniques for giving machines the ability to learn the editors in cooperation with a group of expert referees have chosen important papers that empirically study theoretically analyze or psychologically justify machine learning algorithms the papers are grouped into a dozen categories each of which is introduced by the editors planning or reasoning about actions is a fundamental element of intelligent behavior and one that artificial intelligence has found very difficult to implement the most well understood approach to building planning systems has been under refinement since the late 1960s and has now reached a level of maturity where there are good prospects for building working planners practical planning is an in depth examination of this classical planning paradigm through an intensive case study of sipe a significantly implemented planning system the author the developer of sipe defines the planning problem in general explains why reasoning about actions is so complex and describes all parts of the sipe system and the algorithms needed to achieve efficiency details are discussed in the context of problems and important issues in building a practical planner discussions of how other systems address these issues are also included assuming only a basic background contributions to their development this book is a complete guide to the c4 5 system as implemented in c for the unix environment it contains a comprehensive guide to the system s use the source code about 8 800 lines and implementation notes c4 5 starts with large sets of cases belonging to known classes the cases described by any mixture of nominal and numeric properties are scrutinized for patterns that allow the classes to be reliably discriminated these patterns are then expressed as models in the form of decision trees or sets of if then rules that can be used to classify new cases with emphasis on making the models understandable as well as accurate the system has been applied successfully to tasks involving tens of thousands of cases described by hundreds of properties the book starts from simple core learning methods and shows how they can be elaborated and extended to deal with typical problems such as missing data and over hitting advantages and disadvantages of the c4 5 approach are discussed and illustrated with several case studies this book should be of interest to developers of classification based intelligent systems and to students in machine learning and expert systems courses data preprocessing for data mining addresses one of the most important issues within the well known knowledge discovery from data process data directly taken from the source will likely have inconsistencies errors or most importantly it is not ready to be considered for a data mining process furthermore the increasing amount of data in recent science industry and business applications calls to the requirement of more complex tools to analyze it thanks to data preprocessing it is possible to convert the impossible into possible adapting the data to fulfill the input demands of each data mining algorithm data preprocessing includes the data reduction techniques which aim at reducing the complexity of the data detecting or removing irrelevant and noisy elements from the data this book is intended to review the tasks that fill the gap between the
