since then more and more functional layers have been produced using printing methods printed electronics devices offer properties that give almost every freedom to the creativity of product development flexibility low weight use of non toxic materials simple disposal and an enormous number of units due to the production process are some of the prominent keywords associated with this field screen printing is a widely used process in printed electronics as this process is very flexible with regard to the materials that can be used in addition a minimum resolution of approximately 30 μm is sufficiently high the ink film thickness which can be controlled over a wide range is an extremely important advantage of the process depending on the viscosity layer thicknesses of several hundred nanometres up to several hundred micrometres can be realised the conversion and storage of energy became an increasingly important topic in recent years since regenerative energy sources such as photovoltaics or wind energy often supply energy intermittently appropriate storage systems must be available this applies to large installations for the power supply of society but also in the context of autarkic sensors such as those used in the internet of things or domestic industrial automation a combination of micro energy converters and energy storage devices is an adequate concept for providing energy for such applications in this thesis the above mentioned keywords are addressed and the feasibility of printed thermoelectric energy converters and supercapacitors as energy storage devices are investigated the efficiency of thermoelectric generators teg is low but in industrial environments for example a large amount of unused low temperature heat energy can be found if the production costs of tegs are low conversion of this unused heat energy can contribute to increasing system efficiency additionally printing of supercapacitor energy storage devices increases the usability of the teg it is appropriate to use both components as complementary parts in an energy system den tekniska tillämpningen av skärm och stencilutskrift har varit toppmoderna i årtionden som en del av den subtraktiva produktionsprocessen av tryckta kretskort spelar exempelvis skärm och stencilutskrift en viktig roll i slutet av 1900 talet har ett annat fält öppnat med organisk elektronik sedan dess har allt fler funktionella lager producerats med hjälp av tryckmetoder tryckta elektronikanordningar erbjuder egenskaper som ger nästan all frihet till kreativiteten i produktutvecklingen flexibilitet låg vikt användning av giftfria material enkelt bortskaffande och ett enormt antal enheter på grund av produktionsprocessen är några av de framträdande nyckelord som hör till detta område skärmtryck är en allmänt använd process i tryckt elektronik eftersom processen är mycket flexibel med avseende på material som kan användas dessutom är en minsta upplösning på cirka 30 μm tillräckligt bra
