this best selling text is written for those who use rather than develop statistical methods dr stevens focuses on a conceptual understanding of the material rather than on proving results helpful narrative and numerous examples enhance understanding and a chapter on matrix algebra serves as a review annotated printouts from spss and sas indicate what the numbers mean and encourage interpretation of the results in addition to demonstrating how to use these packages the author stresses the importance of checking the data assessing the assumptions and ensuring adequate sample size by providing guidelines so that the results can be generalized the book is noted for its

extensive applied coverage of manova its emphasis on statistical power and numerous exercises including answers to half the new edition features new chapters on hierarchical linear modeling ch 15 and structural equation modeling ch 16 new exercises that feature recent journal articles to demonstrate the actual use of multiple regression ch 3 manova ch 5 and repeated measures ch 13 a new appendix on the analysis of correlated observations ch 6 expanded discussions on obtaining non orthogonal contrasts in repeated measures designs with spss and how to make the identification of cell id easier in log linear analysis in 4 or 5 way designs updated versions of spss 15 0 and sas 8 0 are used throughout the text and introduced in chapter 1 a book website with data sets and more ideal for courses on multivariate statistics found in psychology education sociology and business departments the book also appeals to practicing researchers with little or no training in multivariate methods prerequisites include a course on factorial anova and covariance working knowledge of matrix algebra is not assumed

the 5th edition of this popular introduction to statistics for the medical and health sciences has undergone a significant revision with several new chapters added and examples refreshed throughout the book yet it retains its central philosophy to explain medical statistics with as little technical detail as possible making it accessible to a wide audience helpful multi choice exercises are included at the end of each chapter with answers provided at the end of the book each analysis technique is carefully explained and the mathematics kept to minimum written in a style suitable for statisticians and clinicians alike this edition features many real and original examples taken from the authors combined many years experience of designing and analysing clinical trials and teaching statistics students of the health sciences such as medicine nursing dentistry physiotherapy occupational therapy and radiography should find the book useful with examples relevant to their disciplines the aim of training courses in medical statistics pertinent to these areas is not to turn the students into medical statisticians but rather to help them interpret the published scientific literature and appreciate how to design studies and analyse data arising from their own projects however the reader who is about to design their own study and collect analyse and report on their own data will benefit from a clearly written book on the subject which provides practical guidance to such issues the practical guidance provided by this book will be of use to professionals working in and or managing clinical trials in academic public health government and industry settings particularly medical statisticians clinicians trial co ordinators its practical approach will appeal to applied statisticians and biomedical researchers in particular those in the biopharmaceutical industry medical and public health organisations
