in the decade following the publication of the first edition of cellular biology of the uterus advances in this field have been so rapid as to require not merely a revision of the earlier text but an essentially new volume even the title of the book has been changed to biology of the uterus to reflect the incorporation of more material based on classical anatomy and physiology this histological and embryological information provides a necessary though often lacking background for the protein chemist and molecular biologist and a bridge between biochemistry and biophysics on the one hand and clinical medicine on the other thus major practical problems in human reproduction such as the mode of action of contraceptive agents and the cause of the initiation of labor may be approached on a firm scientific footing this text deals primarily with the biology of the uterus itself comparative and human rather than with placentation or pregnancy and as such is a synthesis of data derived from many techniques conventional and modern inasmuch as it is clearly beyond the competence of anyone scientist to prepare such a text on the basis of personal knowledge and experience the aid of distinguished biologists from this country and abroad was enlisted all of these authors acknowledged experts in their respective fields agreed to extensive revision of their chapters or preparation of entirely new contributions written by a senior examiner john campton this ccea as biology student unit guide is the essential study companion for unit 2 organisms and biodiversity this full colour book includes all you need to know to prepare for your unit exam clear guidance on the content of the unit with topic summaries knowledge check questions and a quick reference index examiner s advice throughout so you will know what to expect in the exam and will be able to demonstrate the skills required exam style questions with graded student responses so you can see clearly what is required to get a better grade as a result of the recent expansion of nuclear magnetic resonance in biomedicine a number of workshops and schools have been organized to introduce the nmr principles to a wider group of biologists radiologists neurologists etc the aim of most of these courses was to provide a common vocabulary and enough information about pulse sequences relaxation times etc in order to facilitate the use of the various types of nmr imaging systems however no courses were organized for the physicists who were responsible for the origin and evolution of the ideas in this area this enrico fermi school was therefore organized the topics discussed included the theoretical interpretation and prediction of nmr signals the study of new imaging techniques up to the building of special basic fundamentals of bioinformatic skills such as data mining data integration sequence analysis and gene expression analysis as well as scientists who are interested in current research in computational biology and bioinformatics including next generation sequencing transcriptional analysis and drug design because of the rapid development of new technologies in molecular biology new bioinformatic techniques emerge accordingly to keep the pace of in silico development of life science this book focuses partly on such new techniques and their applications in biomedical science these techniques maybe useful in identification of some diseases and cellular disorders and narrow down the number of experiments required for medical diagnostic an innovative introduction to ecology and evolution this unique textbook introduces undergraduate students to quantitative models and methods in ecology behavioral ecology evolutionary biology and conservation it explores the core concepts shared by these related fields using tools and practical skills such as experimental design generating phylogenies basic statistical inference and persuasive grant writing and contributors use examples from their own cutting edge research providing diverse views to engage students and broaden their understanding this is the only textbook on the subject featuring a collaborative active often found in mm cm thick assemblages which can be stratified due to environmental gradients such as light oxygen or sulfide microbial mat communities are commonly observed under extreme environmental conditions deriving energy primarily from light and or reduced chemicals to drive autotrophic fixation of carbon dioxide microbial mat ecosystems are regarded as living analogues of primordial systems on earth and they often form perennial structures with conspicuous stratifications of microbial populations that can be studied in situ under stable conditions for many years consequently microbial mat communities are ideal natural laboratories and represent excellent model systems for studying microbial community structure and function microbial dynamics and interactions and discovery of new microorganisms with novel metabolic pathways potentially useful in future industrial and or medical applications due to their relative simplicity and organization microbial mat communities are often excellent testing grounds for new technologies in microbiology including micro sensor analysis stable isotope methodology and modern genomics integrative studies of microbial mat communities that combine modern biogeochemical and molecular biological methods with traditional microbiology macro ecological approaches and community network modeling will provide new and detailed insights regarding the systems biology of microbial mats and the complex interplay among individual populations and their physicochemical environment these processes ultimately control the biogeochemical cycling of energy and or nutrients in microbial systems similarities in microbial community function across different types of communities from highly disparate environments may provide a deeper basis for understanding microbial community dynamics and the ecological role of specific microbial populations approaches and concepts developed in highly constrained relatively stable
