Combinatorial Game Theory 2013-08-01

combinatorial game theory is the study of two player games with no hidden information and no chance elements the theory assigns algebraic values to positions in such games and seeks to quantify the algebraic and combinatorial structure of their interactions its modern form was introduced thirty years ago with the publication of the classic winning ways for your mathematical plays by berlekamp conway and guy and interest has rapidly increased in recent decades this book is a comprehensive and up to date introduction to the subject tracing its development from first principles and examples through many of its most recent advances roughly half the book is devoted to a rigorous treatment of the classical theory the remaining material is an in depth presentation of topics that appear for the first time in textbook form including the theory of misère quotients and berlekamp s generalized temperature theory packed with hundreds of examples and exercises and meticulously cross referenced combinatorial game theory will appeal equally to students instructors and research professionals more than forty open problems and conjectures are mentioned in the text highlighting the many mysteries that still remain in this young and exciting field aaron siegel holds a ph d in mathematics from the university of california berkeley and has held positions at the mathematical sciences research institute and the institute for advanced study he was a partner at berkeley quantitative a technology driven hedge fund and is presently employed by twitter inc

Lessons in Play 2007-07-02

combinatorial games are games of pure strategy involving two players with perfect information and no element of chance starting from the very basics of gameplay and strategy the authors cover a wide range of topics from game algebra to special classes of games classic techniques are introduced and applied in novel ways to analyze both old and

Games of No Chance 3 2009-05-29

this fascinating look at combinatorial games that is games not involving chance or hidden information offers updates on standard games such as go and hex on impartial games such as chomp and wythoff s nim and on aspects of games with infinitesimal values plus analyses of the complexity of some games and puzzles and surveys on algorithmic game theory on playing to lose and on coping with cycles the volume is rounded out with an up to date bibliography by fraenkel and for readers eager to get their hands dirty a list of unsolved problems by guy and nowakowski highlights include some of siegel s groundbreaking work on loopy games the unveiling by friedman and landsberg of the use of renormalization to give very intriguing results about chomp and nakamura s counting liberties in capturing races of go like its predecessors this book should be on the shelf of all serious games enthusiasts

Lessons in Play 2019-04-30

this second edition of lessons in play reorganizes the presentation of the popular original text in combinatorial game theory to make it even more widely accessible starting with a focus on the essential concepts and applications it then moves on to more technical material still written in a textbook style with supporting evidence and proofs the authors add many more exercises and examples and implement a two step approach for some aspects of the material involving an initial introduction examples and basic results to be followed later by more detail and abstract results features employs a widely accessible style to the explanation of combinatorial game theory contains multiple case studies expands further directions and applications of the field includes a complete rewrite of cgsuite material

Tom Rodgers 2020-03-06

the gathering 4 gardner is a biannual conference founded and for many years organized by tom rogers to celebrate the spirit of martin gardner while primarily concerned with recreational mathematics most of gardner s intellectual interests are featured including magic literature philosophy puzzles art and rationality gardner s writing inspired several generations of mathematicians by introducing us to the joy of discovery and exploration and the gathering s aim is to continue that tradition of inspiration this volume a tribute to rogers and gardner consists of papers originally presented at the gathering 4 gardner meetings recreational mathematics is strongly prominent with contributions from neil sloane richard guy solomon golomb barry cipra erik demaine and many others there are games and puzzles including new nim like games chess puzzles coin weighings coin flippings and contributions that combine art and puzzles or magic and puzzles two historical articles present the stories of combinatorial game theory and the search for god s number for rubik s cube anyone who finds pleasure in clever and intriguing intellectual puzzles will find much to enjoy in barrycades and septoku

From Frenet to Cartan: The Method of Moving Frames

2017-03-29

the method of moving frames originated in the early nineteenth century with the notion of the frenet frame along a curve in euclidean space later darboux expanded this idea to the study of surfaces the method was brought to its full power in the early twentieth century by elie cartan and its development continues today with the work of fels olver and others this book is an introduction to the method of moving frames as developed by cartan at a level suitable for beginning graduate students familiar with the geometry of curves and surfaces in euclidean space the main focus is on the use of this method to compute local geometric invariants for curves and surfaces in various 3 dimensional homogeneous spaces including euclidean minkowski equi affine and projective spaces later chapters include applications to several classical problems in differential geometry as well as an introduction to the nonhomogeneous case via moving frames on riemannian manifolds the book is written in a reader friendly style building on already familiar concepts from curves and surfaces in euclidean space a special feature of this book is the inclusion of detailed guidance regarding the use of the computer algebra system maple to perform many of the computations involved in the exercises
