the subjects of the symposia are on composite materials with matrices behaving as brittle in normal or special conditions brittle matrix composites are applied in various domains civil engineering mechanical equipment and machinery vehicles etc and in the last decades their importance is increasing together with their variety papers include aggregate binder composites concretes fibre concretes rocks sintered materials ceramics high strength composites with brittle matrices in principle the general problems of structures made of composite materials are not included in the papers various approaches to the material engineering problems are presented in the papers

addressing the interactions between the different design and construction variables and techniques this book illustrates best practices for constructing economical long life concrete pavements the book proceeds in much the same way as a pavement construction project first different alternatives for concrete pavement solutions are outlined the desired performance and behaviour parameters are identified next appropriate materials are outlined and the most suitable concrete proportions determined the design can be completed and then the necessary construction steps for translating the design into a durable facility are carried out although the focus reflects highways as the most common application special features of airport industrial and light duty pavements are also addressed use is made of modeling and performance tools such as hipervap and ltpv to illustrate behavior and performance along with some case studies as concrete pavements are more complex than they seem and the costs of mistakes or of over design can be high this is a valuable book for engineers in both the public and private sectors
