Water softeners are used to remove hardness-causing minerals from water. Hard water can cause a variety of problems, including scale buildup on pipes and appliances, dry skin and hair, and inefficient cleaning. Water softeners work by exchanging calcium and magnesium ions with sodium ions. This process is called ion exchange. There are two main types of water softeners: tank-based and tankless. Tank-based softeners are the most common and are typically installed in a basement or laundry room. Tankless softeners are smaller and are typically installed under the sink. Both types of softeners can be used to soften water for drinking, bathing, and washing. The most common type of water softener is a tank-based system. These systems use a tank filled with resin to remove hardness minerals from water. The resin is charged with sodium ions, which are exchanged with calcium and magnesium ions in the water. This process is called ion exchange. The soft water then flows out of the tank and into your home's plumbing system. Tankless water softeners are a newer technology that uses a different type of resin. They are smaller and more compact than tank-based systems. They also use ion exchange to remove hardness minerals from water. However, they are typically more expensive than tank-based systems.
