introduction one of the basic tenets of good health is that you have all your five senses in perfect working condition these include vision smell hearing touch and taste that is the reason why responsible parents need to make sure that their children do not suffer from any sort of ear maladies which can possibly lead to deafness as time goes by i remember taking over a teaching job temporarily for a friend more than two decades ago i had to take care of three year old nursery children which was about as perilous a job as one could ever wish for now there was this very bright eyed little baby boy who had never spoken a word his parents were identified that he was deaf but they had got his ears checked up to make sure that he was not suffering from any possible birth defects three years old not one peep and not one sound out of him it was worrying until one fine afternoon he announced to his parents that they had better ask me to be his teacher and his teacher alone because he did not want to share me with the rest of his classmates when his nearly tearful father asked him why he had not spoken for all these years he said very practically that they had made sure that he did not need to talk ever because all his needs were fulfilled besides that they did all the talking all the time so why did he need to talk this young gentleman is now at college and one cannot stop him talking he has a keen debater and intends to argue the point on every small matter whenever he can however he can whenever he can when once i recounted to him episodes in the life and times of a three year old he gives me a come off it ma am look he never talk not going to happen when i was a little child my grandfather often told me about a ritual which the elders practice whenever a child was

born they rang the silver bell behind him to bring all the good spirits near the new born child to bless it and if the child followed the sound of the bell they would consider that it would live a good and virtuous life according to me this was the way in which they managed to find out whether the child was not suffering from congenital deafness also i keep wondering about those poor little children who were scared out of their diapers with that harsh clanging noise however much their elders considered it to be musical the bell was rung over me when i was born according to my grandfather i heard it and set up a howl fit to burst the eardrums of everybody in the vicinity and got all the nurses running to soothe me this not only proved that i was able to hear but i was also going to be a potential critic of all the idiotic actions adults did in the future so this book is going to tell you all about your ears how to take care of them and some ailments of the ears which can be treated either naturally or by your doctors

**Deafness** 1989-01-01 since the first edition was published in 1998 considerable advances have been made in the fields of pitch perception and speech perception in addition there have been major changes in the way that hearing aids work and the features they offer this book will provide an understanding of the changes in perception that take place when a person has cochlear hearing loss so the reader understands not only what does happen but why it happens it interrelates physiological and perceptual data and presents both this and basic concepts in an integrated manner the goal is to convey an understanding of the perceptual changes associated with cochlear hearing loss of the difficulties faced by the hearing impaired person and the limitations of current hearing aids
