mechanobiology the study of the effects of mechanical environments on the biological processes of cells has evolved from traditional biomechanics via the incorporation of strong elements of molecular and cell biology currently a broad range of organ systems are being studied by surgeons physicians basic scientists and engineers these mechanobiologists aim to create new therapies and further biological understanding by quantifying the mechanical environment of cells and the molecular mechanisms of mechanically induced pathological conditions to achieve these goals investigators must be familiar with both the basic concepts of mechanics and the modern tools of cellular molecular biology unfortunately current literature contains numerous studies that misuse standard mechanical estimations and terminology or fail to implement appropriate molecular analyses therefore the mechanobiology handbook not only presents cutting edge research findings across various fields and organ systems but also provides the elementary chapters on mechanics and molecular analysis techniques to encourage cross field understanding and appropriate planning aided by the continuous advancement of research tools in both mechanics and biology more sophisticated experiments and analyses are possible thus fueling the growth of the field of mechanobiology considering the complexity of the mechanics and the biology of the human body most of the world of biomechanics remains to be studied since the field is still developing the mechanobiology handbook does not force one unified theory but brings out many different viewpoints and approaches to stimulate further research questions

tissue engineering is the use of a combination of cells engineering and materials methods and suitable biochemical and physio chemical factors to improve or replace biological functions while most definitions of tissue engineering cover a broad range of applications in practice the term is closely associated with applications that repair or replace portions of or whole tissues i e bone cartilage blood vessels bladder etc often the tissues involved require certain mechanical and structural properties for proper function the term has also been applied to efforts to perform specific biochemical functions using cells within an artificially created support system e g an artificial pancreas or a bioartificial liver the term regenerative medicine is often used synonymously with tissue engineering although those involved in regenerative medicine place more emphasis on the use of stem cells to produce tissues
