Approximate Formulas for the Computation of Turbulent Boundary-layer Momentum Thicknesses in Compressible Flows

1946

summary approximate formulas for the computation of the momentum thicknesses of turbulent boundary layers on two dimensional bodies on bodies of revolution at zero angle of attack and on the inner surfaces of round channels all in compressible flow are given in the form of integrals that can be conveniently computed the formulas involve the assumptions that the momentum thickness may be computed by use of a boundary layer velocity profile which is fixed

and that skin friction formulas for flat plates may be used in the computation of boundary layer thicknesses in flow with pressure gradients the effect of density changes on the ratio of the displacement thickness to the momentum thickness of the boundary layer is taken into account use is made of the experimental finding that the skin friction coefficient for turbulent flow is independent of mach number the computations indicated that the effect of density changes on the momentum thickness in flows with pressure gradients is small for subsonic flows

this book shows that much of classical integral geometry can be derived from the coarea formula by some elementary techniques howard generalizes much of classical integral geometry from spaces of constant sectional curvature to arbitrary riemannian homogeneous spaces to do so he provides a general definition of an integral invariant of a submanifold of the space that is sufficiently general enough to cover most cases that arise in integral geometry working in this generality makes it clear that the type of integral geometric formulas that hold in a space does not depend on the full group of isometries but only on the isotropy

subgroup as a special case integral geometric formulas that hold in euclidean space also hold in all the simply connected spaces of constant curvature detailed proofs of the results and many examples are included requiring background of a one term course in riemannian geometry this book may be used as a textbook in graduate courses on differential and integral geometry

integral representations of holomorphic functions play an important part in the classical theory of functions of one complex variable and in multidimensional complex analysis in the later case alongside with integration over the whole boundary ∂D of a domain D we frequently encounter integration over the shilov boundary S_D they solve the classical problem of recovering at the points of a domain D a holomorphic function that is sufficiently well behaved when approaching the boundary ∂D from its values on ∂D or on S_D alongside with this classical problem it is possible and natural to consider the following one to recover the holomorphic function in D from its values on some set $M \subset \partial D$ not containing S_D of course M is to be a set of uniqueness for the class of holomorphic functions under consideration for example for the functions continuous in D or belonging to the hardy class H^p
