# Chemical Kinetics and Mechanism

2007-10-31

chemical kinetics and mechanism considers the role of rate of reaction it begins by introducing chemical kinetics and the analysis of reaction mechanism from basic well established concepts to leading edge research organic reaction mechanisms are then discussed encompassing curly arrows nucleophilic substitution and e1 and e2 elimination reactions the book concludes with a case study on zeolites which examines their structure and internal dimensions in relation to their behaviour as molecular sieves and catalysts the accompanying cd rom contains the kinetics toolkit a graph plotting application designed for manipulation and analysis of kinetic data which is built into many of the examples questions and exercises in the text there are also interactive activities illustrating reaction mechanisms the molecular world series provides an integrated introduction to all branches of chemistry for both students wishing to specialise and those wishing to gain a broad understanding of chemistry and its relevance to the everyday world and to other areas of science the books with their case studies and accompanying multi media interactive cd roms will also provide valuable resource material for teachers and lecturers the cd roms are designed for use on a pc

extracellular acid base state reflects the performance of many exchange functions at the organism level respiration and ventilation of the gas exchange surfaces metabolism and osmoregulation such functions are much influenced by ambient conditions and the measurement of acid base parameters thus provides useful information about the organism's responses to environmental challenges secondly many processes at the molecular level are now known to be pH sensitive and acid base regulation thus appears to be a major requirement for the functional integrity of cells and organisms how extracellular acid base balance can be maintained in a wide variety of animals living in different conditions is the subject of this book the approach is comparative and environmental throughout all body fluids share similar buffer properties and common physicochemical principles apply to any acid base system however in accord with differing designs and constraints along animal evolution varying effector organs and mechanisms are at work to maintain an appropriate acid base state in the organism particular emphasis is placed on the fundamental differences between water and air breathers and on the acid base and respiratory problems arising at the transition from an aquatic to a terrestrial life also the complex array of factors influencing the acid base state in water dwelling animals is thoroughly discussed
