an examination of the precise code that connects ancient spirituality with modern science shows how the numerical patterns in ancient philosophies are evident in both the structure of the universe and the helical structure of dna reveals that music theory comes from an intuitive understanding of the

resonant harmony of the cosmos many have observed the distinct numerical patterns embedded in ancient philosophies and religions from all over the world others have noted that these same patterns are apparent in many of the theories of groundbreaking science michael hayes reveals that there is a precise code the hermetic code that connects these patterns information once known to ancient cultures but apparently lost over time mirrored in the structure of this code are the ordering principles of the universe and intriguingly also the harmonic ratios of music our notions of what is harmonious in music may therefore arise not from an abstract aesthetic sense but as a response to an intuition of a fundamental cosmic harmony the resonance between biology and cosmology shows that life is music complete with overtones nowhere more strikingly present than in the helical structure of life itself dna

the application of computational methods to solve scientific and practical problems in genome research created a new interdisciplinary area that transcends boundaries traditionally separating genetics biology mathematics physics and computer science computers have of course been intensively used in the field of life sciences for many years even before genome research started to store and analyze dna or protein sequences to explore and model the three dimensional structure the dynamics and the function of biopolymers to compute genetic linkage or evolutionary processes and more the rapid development of new molecular and genetic technologies combined with ambitious goals to explore the structure and function of genomes of higher organisms has generated however not only a huge and exponentially increasing body of data but also a new class of scientific questions the nature and complexity of these questions will also require beyond establishing a new kind of alliance between experimental and theoretical disciplines the development of new generations both in computer software and hardware technologies new theoretical procedures combined with powerful computational facilities will substantially extend the horizon of problems that genome research can attack with success many of us still feel that computational models rationalizing experimental findings in genome research fulfill their promises more slowly than desired there is also an uncertainty concerning the real position of a theoretical genome research in the network of established disciplines integrating their efforts in this field
