this special issue with 35 published articles shows the significance of the topic signal processing and analysis of electrical circuit this topic has been gaining increasing attention in recent times the presented articles can be categorized into four different areas signal processing and analysis methods of electrical circuits electrical measurement technology applications of signal processing of electrical equipment fault diagnosis of electrical circuits it is a fact that the development of electrical systems signal processing methods and circuits has been accelerating electronics applications related to electrical circuits and signal processing methods have gained noticeable attention in recent times the methods of signal processing and electrical circuits are widely used by engineers and scientists all over the world the constituent papers represent a significant contribution to electronics and present applications that can be used in industry further improvements to the presented approaches are required for realizing their full potential

this book is designed as an interdisciplinary platform for specialists working in electric and plug in hybrid electric vehicles powertrain design and development and for scientists who want to get access to information related to electric and hybrid vehicle energy management efficiency and control the book presents the methodology of simulation that allows the specialist to evaluate electric and hybrid vehicle powertrain energy flow efficiency range and consumption the mathematics behind each electric and hybrid vehicle component is explained and for each specific vehicle the powertrain is analyzed and output results presented through the use of specific automotive industrial software avl cruise ipg carmaker avl concerto this methodology of electric and hybrid powertrain design serves to broaden understanding of how the energy flow efficiency range and consumption of these vehicles can be adjusted updated and predicted via development processes

definition and nomenclature a stirling engine is a mechanical device which operates on a closed regenerative thermodynamic cycle with cyclic compression and expansion of the working fluid at different temperature levels the flow of working fluid is controlled only by the internal volume changes there are no valves and overall there is a net conversion of heat to work or vice versa this generalized definition embraces a large family of machines with different functions characteristics and configurations it includes both rotary and reciprocating systems utilizing mechanisms of varying complexity it covers machines capable of operating as a prime mover or power system converting heat supplied at high temperature to output work and waste heat at a lower temperature it also covers work consuming machines used as refrigerating systems and heat pumps abstracting heat from a low temperature source and delivering this plus the heat equivalent of the work consumed to a higher temperature finally it covers work consuming devices used as pressure generators compressing a fluid from a low pressure to a higher pressure very similar machines exist which operate on an open regenerative cycle where the flow of working fluid is controlled by valves for convenience these may be called ericsson engines but unfortunately the distinction is not widely established and regenerative machines of both types are frequently called stirling engines
