polyphenols are a heterogeneous group of bioactive compounds mainly found in plant based foods numerous clinical and epidemiological studies have led to the result that polyphenol intake may protect against chronic diseases such as cardiovascular and neurodegenerative diseases cancer or type 2 diabetes to name some polyphenol intake estimation can be obtained through food frequency questionnaires and nutritional biomarkers both having their own advantages and disadvantages although the association between these bioactive compounds and health seems irrefutable many questions remain still unanswered for instance more studies are needed to identify possible interactions and effect modulating variables such as smoking habit body mass index sex alcohol hormones other foods etc moreover intestinal microbiota seems to play an important role in the metabolism of polyphenols but it is still unclear how

since the beginning of the 21st century there has been a rapid increase in our understanding of the cellular trafficking mechanisms of molecular chaperones in eukaryotes and in prokaryotes in the former molecular chaperone trafficking can occur between the various cellular compartments with concomitant movement of other proteins such events can also result in the release of molecular chaperones from cells in bacteria molecular chaperones are involved in the trafficking of other proteins and are themselves released into the external milieu the increasing appreciation of the role of molecular chaperones and protein folding catalysts in the interplay between bacteria and the cells of their hosts is now an important area of research for understanding the mechanisms of infectious diseases

this volume brings together experts in the biochemistry cellular biology immunology and molecular biology of molecular chaperones and protein folding catalysts with a focus on the mechanisms of cellular trafficking of these proteins and the role of these variegated trafficking mechanisms in both human and animal health and disease
