around the world and throughout history in cultures as diverse as ancient mesopotamia and modern america human beings have been compelled by belief in gods and developed complex religions around them but why what makes belief in supernatural beings so widespread and why are the gods of so many different people so similar in nature this provocative book explains the origins and persistence of religious ideas by looking through the lens of science at the common structures and functions of human thought the first general introduction to the cognitive science of religion minds and gods presents the major themes theories and thinkers involved in this revolutionary new approach to human religiosity arguing that we cannot understand what we think until we first understand how we think the book sets out to study the evolutionary forces that modeled the modern human mind and continue to shape our ideas and actions today todd tremlin details many of the adapted features of the brain illustrating their operation with examples of everyday human behavior and shows how mental endowments inherited from our ancestral past lead many people to naturally entertain religious ideas in short belief in gods and the social formation of religion have their genesis in biology in powerful cognitive processes that all humans share in the course of illuminating the nature of religion this book also sheds light on human nature why we think we do the things we do and how the reasons for these things are so often hidden from view this discussion ranges broadly across recent scientific findings in areas such as paleoanthropology primate studies evolutionary psychology early brain development and cultural transmission while these subjects are complex the story is told here in a conversational style that is engaging jargon

research on resting state brain activity using fmri offers a novel approach for understanding brain organization at the systems level resting state fmri examines spatial synchronization of intrinsic fluctuations in blood oxygenation level dependent bold signals arising from neuronal and synaptic activity that is present in the absence of overt cognitive information processing since the discovery of coherent spontaneous fluctuations within the somatomotor system biswal et al 1995 a growing number of studies have shown that many of the brain areas engaged during various cognitive tasks also form coherent large scale brain networks that can be readily identified using resting state fmri these studies are beginning to provide new insights into the functional architecture of the human brain this research topic will synthesize current knowledge about resting state brain activity and discuss their implications for understanding brain function and dysfunction from a systems neuroscience perspective this topic will also provide perspectives on important conceptual and methodological questions that the field needs to address in the next years in addition to invited reviews and perspectives we solicit research articles on theoretical experimental and clinical questions related to the nature origins and functions of resting state brain activity
