expedition in the 1830s and his subsequent findings from research correspondence and experimentation various evolutionary ideas had already been proposed to explain new findings in biology there was growing support for such ideas among dissident anatomists and the general public but during the first half of the 19th century the english scientific establishment was closely tied to the church of england while science was part of natural theology ideas about the transmutation of species were controversial as they conflicted with the beliefs that species were unchanging parts of a designed hierarchy and that humans were unique unrelated to other animals the political and theological implications were intensely debated but transmutation was not accepted by the scientific mainstream the book was written for non specialist readers and attracted widespread interest upon its publication as darwin was an eminent scientist his findings were taken seriously and the evidence he presented generated scientific philosophical and religious discussion

Cell and Molecular Biology 2018-01-26 charles darwin s groundbreaking work of evolutionary biology the origin of species introduces the scientific theory of evolution which posits that species evolve over a period of many generations through a process of natural selection darwin s theories have been widely embraced by the scientific community as fact and have laid the foundation for subsequent major advances in the field of biology it is arguably one of the most important scientific treatises ever written this is the sixth edition of the formative text of evolutionary biology charles robert darwin was an english naturalist who realised and presented compelling evidence that all species of life have evolved over time from common ancestors through the process he called natural selection his 1859 book on the origin of species established evolutionary descent with modification as the dominant scientific explanation of diversification in nature he examined human evolution and sexual selection in the descent of man and selection in relation to sex followed by the expression of the emotions in man and animals his research on plants was published in a series of books and in his final book he examined earthworms and their effect on soil
