this study represents the latest in a series of research activities aimed at a better understanding of the origin and fate of air pollution within the built environment most previous studies of air pollution in cultural institutions have focused on gases particles were ignored for many reasons they seemed to be more easily removed by the building gaseous air pollutants had been well studied by industry and their effects on commercial products were heavily documented and many particle types were considered chemically benign to almost all surfaces even carbon black which is now known to pose enormous degradation risks to the optical and color qualities of paintings and tapestries is almost totally inert recognizing this and understanding that we needed to know much more about the physics of particle intrusion in museum buildings in 1987 the environmental engineering lab at the california institute of technology under contract to the getty conservation institute began a detailed examination of five different museums in southern california these structures represent a diverse range of architectural and ventilation types through this study a powerful computer model was developed that could predict the soiling effects of changes made to the operation or maintenance of a building this model can even be used to estimate the soiling rates of new buildings or major rehabilitations before any construction work is begun this is an important contribution to both the conservation community and the broader field of air quality science

food manufacturing has evolved over the centuries from kitchen industries to modern sophisticated production operations a typical food factory includes the food processing and packaging lines the buildings and exterior landscaping and the utility supply and waste treatment facilities as a single individual is unlikely to possess all the necessary skills required to facilitate the design the task will undoubtedly be undertaken by an interdisciplinary team employing a holistic approach based on a knowledge of the natural and biological sciences most engineering disciplines and relevant legislation in addition every successful project requires a competent project manager to ensure that all tasks are completed on time and within budget this handbook attempts to compress comprehensive up to date coverage of these areas into a single volume it is hoped that it will prove to be of value across the food manufacturing community the multi disciplinary nature of the subject matter should facilitate more informed communication between individual specialists on the team it should also provide useful background information on food factory design for a wider range of professionals with a more peripheral interest in the subject for example process plant suppliers contractors hse specialists retailers consultants and financial institutions finally it is hoped that it will also prove to be a valuable reference for students and instructors in the areas of food technology chemical engineering and mechanical engineering in particular

genetic engineering nanotechnology astrophysics particle physics we live in an engineered world one where the distinctions between science and engineering technology and research are fast disappearing this book shows how at the dawn of the twenty first century the goals of natural scientists to discover what was not known and that of engineers to create what did not exist are undergoing an unprecedented convergence sunny y auyang ranges widely in demonstrating that engineering today is

not only a collaborator with science but its equal in concise accounts of the emergence of industrial laboratories and chemical and electrical engineering and in whirlwind histories of the machine tools and automobile industries and the rise of nuclear energy and information technology her book presents a broad picture of modern engineering its history structure technological achievements and social responsibilities its relation to natural science business administration and public policies auyang uses case studies such as the development of the f 117a nighthawk and boeing 777 aircraft as well as the experiences of engineer scientists such as oliver heaviside engineer entrepreneurs such as henry ford and bill gates and engineer managers such as alfred sloan and jack welch to give readers a clear sense of engineering s essential role in the future of scientific research table of contents preface 1 introduction 2 technology takes off 2 1 from practical art to technology 2 2 construction becomes mathematical 2 3 experimenting with machines 2 4 science and chemical industries 2 5 power and communication 3 engineering for information 3 1 from microelectronics to nanotechnology 3 2 computer hardware and software 3 3 wireless satellites and the internet 4 engineering in society 4 1 social ascent and images of engineers 4 2 partnership in research and development 4 3 contributions to sectors of the economy 5 innovation by design 5 1 inventive thinking in negative feedback 5 2 design processes in systems engineering 5 3 â œworking togetherâ in aircraft development 5 4 from onboard computers to door hinges 6 sciences of useful systems 6 1 mathematics in engineering and science 6 2 information and control theories 6 3 wind tunnels and internet simulation 6 4 integrative materials engineering 6 5 biological engineering frontiers 7 leaders who are engineers 7 1 business leaders in the car industry 7 2 public policies and nuclear power 7 3 managing technological risks appendix a statistical profiles of engineers appendix b u s research and development notes index i am impressed by the scope of engineering an endless frontier and fascinated by sunny auyang s comprehensive knowledge of the subject this is just the kind of book the national academy of engineering has been encouraging to promote the importance of engineering to the public it will have a long shelf life in that it pulls together material that is not readily accessible and will serve as a reference for anyone interested in engineering as a profession engineering needs this book john hutchinson harvard university engineering an endless frontier is extraordinary in scope sunny auyang describes the different kinds of contemporary engineering practices and productions attempts to provide historical background explains the scientific basis for engineering innovation in different fields and addresses the broad systems level managerial entrepreneurial and design activities of professionals it s rare to find a single author who can grasp and explain the essential features of modern technologies across such an array of industrial sectors and engineering disciplines and explain how they work why they work they way they do and what is required for their innovation development and yes even maintenance louis l bucciarelli professor emeritus of engineering and technology studies mit

focusing on contaminant fate and transport design of environmental control systems and regulatory constraints this textbook details the fundamental equations that describe the fate and transport of contaminants in the water environment the application of these fundamental equations to the design of environmental control systems and methodologies for assessing the impact of contaminant discharges into rivers lakes wetlands ground water and oceans are all covered readers learn to assess how much waste can be safely assimilated into a water body by developing a solid understanding of the relationship between the type of pollutant discharged the characteristics of the receiving water and physical chemical and biological impacts in

cases of surface runoff from urban and agricultural watersheds quantitative relationships between the quality of surface runoff and the characteristics of contaminant sources located within the watersheds are presented some of the text s distinguishing features include its emphasis on the engineering design of systems that control the fate and transport of contaminants in the water environment the design of remediation systems and regulatory constraints particular attention is given to use attainability analyses and the estimation of total maximum daily loads both of which are essential components of water quality control in natural systems readers are provided with a thorough explanation of the complex set of laws and regulations governing water quality control in the united states proven as an effective textbook in several offerings of the author s class water quality control in natural systems the flow of the text is carefully structured to facilitate learning moreover a number of practical pedagogical tools are offered practical examples used throughout the text illustrate the effects of controlling the quality quantity timing and distribution of contaminant discharges into the environment end of chapter problems and an accompanying solutions manual help readers assess their grasp of each topic as they progress through the text several appendices with useful reference material are provided including current u s water quality standards detailed bibliography guides readers to additional resources to explore particular topics in greater depth with its emphasis on contaminant fate and transport and design of environmental control systems this text is ideal for upper level undergraduates and graduate students in environmental and civil engineering programs environmental scientists and practicing environmental civil engineers will also find the text relevant and useful

there is growing awareness of environmental pollution but the problem of abatement and control remains unsolved this is due to lack of knowledge in monitoring methodology and control measures in our teaching programmes an attempt is made in this book to fill up this gap the introductory chapter covers grim picture of pollution in india and abroad this is followed by discussion on choice of methods of monitoring and brief account of modern methods of environmental analysis the consideration of air pollution will not be complete without the knowledge of air pollution meterology and monitoring and it is covered in next few chapters the water pollution not only considers mode of analysis but also of treatment the challenging problem is posed by industrial effluent and sewage from the viewpoint of treatment and control agricultural pollution largely encompasses ill effects of pesticides which are separately discussed the solid waste hazardous waste and biomedical waste are new problems of this century an upto date account on their characteristion treatment and disposal are given next chapters noise pollution thermal pollution radiation hazards have their own role to play their abetment is must inspite of collecting large data on pollution future planning and control cannot be undertaken without the knowledge of environmental impact assessment and environmental modelling these topics are briefly covered at end of book this book should be indispensable for graduate and post graduate programmes in environmental science and engineering with due emphasis on monitoring and control adequate references are provided in each chapter and also in bibliography this will help serious workers in environmental technology practicing chemist and environmental engineers

it is crucial that engineers from students to those already practising have a deep understanding of the environmental threats facing the world if they are to become part of the solution and not the problem is there a way to reconcile modern lifestyles with the compelling need for change could new improved technologies play a key role if great leaps in the environmental efficiency of technologies are needed can they be produced engineers are in a privileged and hugely influential position to innovate design and build a sustainable future but are they engaged or uninterested are they knowledgeable or ignorant this book has been developed by a number of committed educators in european engineering departments under the leadership of delft university of technology and the technical university of catalunya to meet the perceived gap between what engineers know and what they should know in relation to sustainable development the university of delft decided as long ago as 1998 that all of its engineering graduates working towards careers as designers managers or researchers should be prepared for the challenge of sustainable development and as such should leave university able to make sustainable development operational in their designs and daily practices the huge amount of knowledge gathered on best practice teaching for engineers is reflected in this book the aim is to give engineering students a grounding in the challenge that sustainable development poses to the engineering profession the contribution the engineer can make to attaining some of the societal and environmental goals of sustainability and the barriers and pitfalls engineers will likely need to confront in their professional lives concise but comprehensive the book examines the key tools skills and techniques that can be used in engineering design and management to ensure that whole life costs and impacts of engineering schemes are addressed at every stage of planning implementation and disposal the book also aims to demonstrate through real life examples the tangible benefits that have already been achieved in many engineering projects and to highlight how real improvements can be and are being made each chapter ends with a series of questions and exercises for the student to undertake sustainable development for engineers will be essential reading for all engineers and scientists concerned with sustainable development in particular it provides key reading and learning materials for undergraduate and postgraduate students reading environmental chemical civil or mechanical engineering manufacturing and design environmental science green chemistry and environmental management
