The traction motor is the most important part of a locomotive. This motor is mostly a DC series commutator motor. Therefore, it requires regular maintenance. A large number of loco failures are caused due to bad maintenance of traction motors. Therefore, it is essential to ensure proper regular maintenance of traction motors. Traction motors General Electric GE 752 traction motors are furnished. The traction motor is direct current series wound and is separately ventilated by the cleaned air system. The armature is mounted in anti-friction bearings. Motors drive through single reduction spur gearing. They are supported by the axles to which they are geared. This instruction provides inspection maintenance and basic overhaul procedures for all of these motors. See Table I page 3 for the models covered. These motors have a ball bearing and a reinforced this handbook on maintenance of Hitachi traction motor type HS 15250A has been prepared by Camtech with the objective of making our maintenance personnel aware of correct maintenance and overhaul techniques to be adopted in field. A traction motor is an electric motor used for propulsion of a vehicle such as locomotives, electric or hydrogen vehicles or electric multiple unit trains. Features mechanically compatible with the D77 motor. The AC 77 fits in same pedestal position in the locomotive truck bogie. Improved AC motor technology requires less maintenance and repair down time than DC motor. English ABB offers complete electric drivelines for heavy working machinery for example in mining construction and material handling optimized for each machine's actual working cycle. Each motor is tailor made to customer requirements and to the operation conditions of each train that it powers enabling superior efficiency, lowest energy consumption and high reliability. Traction motors include both modular and frameless traction motors. The traction motor is an electric motor used to power the driving wheels of a railway vehicle. Traditionally each traction motor was custom made to fit a specific vehicle. I am looking for EMD maintenance instructions related to the traction motor gear case MI 1520 and to the wheels axles gears MI 1518. These numbers are in MI 3900. I have this traction motor General Maintenance D37 D77 D87 traction motors are powered by electricity and generate the power to rotate the wheels of the train. The turning force produced by traction motors is transmitted to the wheels via the driving gear unit and axle. Traction motors are typically mounted in the trucks where the wheels are housed. This booklet contains general description of train set three phase propulsion system, brief on traction motor and gear box etc. This also comprises OEM's recommended preventive maintenance schedules and spares to be kept at maintenance depots.
